

**Solve each problem.****Answers**

- 1) A movie theater used $Y=(4.5)6$ to calculate how much money they made selling buckets of popcorn where Y is the total and K is the price per bucket. How much would they make if they sold 8 buckets?
- 2) To determine how many pages would be needed to make 3 books you can use the equation, $186=(62)3$. How many pages are in one book?
- 3) Rachel used the equation $Y=KX$ to determine she would need 150 beads to create 3 necklaces. How many beads did she use per necklace?
- 4) A baker used the equation $Y=KX$ to calculate that he had made \$50.35 after selling 5 boxes of his cookies. How much did he make per box?
- 5) An industrial printing machine printed 1674 pages in 9 minutes. How much would it have printed in 6 minutes?
- 6) An ice cream truck driver used the equation $Y=KX$ to show how much money he made selling 8 ice cream bars. He determined he'd make \$12.00. How much did he make per bar sold?
- 7) A grocery store paid \$149.04 for 3 crates of milk. This can be expressed by the equation $Y=KX$. How much would they have paid for 2 crates?
- 8) The equation $Y=KX$ shows you would make \$29.10 for recycling 5 pounds of cans. How much would you make if you recycled 3 pounds?
- 9) The equation $35.37=(11.79)3$ shows how much it cost for a company to buy 3 new uniforms. How much would it cost to buy 2 new uniforms?
- 10) At the hardware store you can buy 2 boxes of bolts for \$9.84. This can be expressed by the equation $9.84=(4.92)2$. How much would it cost for 8 boxes?

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____
8. _____
9. _____
10. _____
